

gymbro

Android Install Guide

For app users: all you need is the .apk file and your phone.

No computer, no expiry, installed in two minutes.

Repository:

[**https://github.com/gagangeet2517-arch/gymbro**](https://github.com/gagangeet2517-arch/gymbro)

Part 1 — install the app · Part 2 — build the .apk file (one person, once)

1. How Android installs work (30 seconds)

gymbro is not on the Play Store. On Android that's no problem: the app can be shared as a single file — `gymbro.apk` — and installed by simply opening that file on the phone. Unlike iPhone, there is **no 7-day expiry** and **no computer needed** to install: once someone has built the `.apk` (Part 2, one person does this once), everyone else just needs the file.

Note: Honesty note: gymbro is developed and tested primarily on iPhone. The Android version is fully functional but has had less real-world testing — if something looks off, report it at github.com/gagangeet2517-arch/gymbro/issues.

2. Part 1 — Install gymbro on your Android phone

You need: the `gymbro.apk` file (from a friend via WhatsApp/Drive/email, or from the project's Releases page on GitHub) and two minutes.

- 1 On the phone, **download / open the .apk file**. From WhatsApp or a browser: tap the file, then tap **Install** if offered. If nothing happens, open the **Files** app → **Downloads** → tap `gymbro.apk`.
- 2 The first time, Android will likely say "**For your security, your phone is not allowed to install unknown apps from this source**". Tap **Settings** on that popup, switch on **Allow from this source**, and go back — the install screen reappears.
- 3 Tap **Install** and wait a few seconds.
- 4 If **Google Play Protect** shows a warning ("app from unknown developer"), tap **More details** → **Install anyway**. This appears for ANY app outside the Play Store — it does not mean something is wrong.
- 5 Tap **Open**. gymbro greets you with a short welcome tour, and small green cards explain each feature the first time you reach it. Done — the app is yours permanently.

2.1 Turn on the AI features (optional, free)

- 1 Go to aistudio.google.com/apikey in a browser, sign in with a Google account, tap **Create API key**, copy it.
- 2 In gymbro: **Home tab** → **Profile** → **AI features · Gemini key** → paste → **Save profile**.

2.2 Updating the app later

Get the newer `.apk` file and open it — it installs over the old version and **keeps all your workouts and meals**. Never "uninstall first"; that would erase your data.

3. Part 2 — Build the .apk (one person does this once)

Someone has to produce the `.apk` file that everyone else installs. There are two ways — the cloud way is far easier and works from any computer (Windows, Mac, or Linux), because Expo's servers do the heavy lifting.

3.1 The easy way — cloud build with EAS (≈20 min, no Android tools needed)

- 1 Install **Node.js** (nodejs.org → the green LTS button → run the installer).
- 2 Get the code: <https://github.com/gagangeet2517-arch/gymbro> → green <> **Code** button → **Download ZIP** → unzip → put the **gymbro-main** folder on your Desktop.

- 3 Create a free account at **expo.dev** (Sign Up — free tier is plenty).
- 4 Open Terminal (Mac: **⌘**+Space → "terminal"; Windows: Start → "PowerShell") and run, one line at a time:

```
cd ~/Desktop/gymbro-main
npm install
npx eas-cli build -p android --profile preview
```

The last command asks you to log in (use the expo.dev account), then uploads the project and builds it on Expo's servers — you can watch the progress link it prints. After ~15 minutes it prints a **download link to the finished .apk**. Download it, send the file to your friends, and point them at Part 1.

Note: The free EAS tier includes a limited number of builds per month and the build may sit in a queue — fine for sharing with friends, not for daily rebuilds.

3.2 The offline way — local build (for developers)

Requires Android Studio (for the Android SDK) and Java 17. Then:

```
npm install
npx expo prebuild -p android
cd android && ./gradlew assembleRelease
```

The finished file appears at `android/app/build/outputs/apk/release/app-release.apk`. Rename it to `gymbro.apk` and share.

3.3 Sharing tip — GitHub Releases

Instead of re-sending files, upload the .apk once to a **Release** on github.com/gagangeet2517-arch/gymbro (Releases → Draft a new release → attach the .apk). Then anyone can download it straight to their phone from the Releases page, and Part 1 is the only guide they ever need.

4. When something goes wrong

4.1 "App not installed" error

- Free up storage space and try again.
- If an older gymbro with a different signature exists, Android refuses to install over it — only then: back up via Profile → Migrate Data → Export, uninstall, install fresh, Import.

4.2 Can't find the downloaded .apk

Files app → Downloads. Or pull down the notification shade — the download notification opens it.

4.3 Play Protect keeps blocking

Tap **More details** on the warning, then **Install anyway**. If there is no such option: Play Store → profile picture → Play Protect → **■** → temporarily switch off "Scan apps", install, switch it back on.

4.4 Voice logging asks for permissions

Allow **Microphone** when prompted (and Camera for food photos). Missed it? Settings → Apps → gymbro → Permissions.

4.5 AI says a key is missing

Section 2.1 — add your free Gemini key in Profile.

5. Where to get help

- Open an issue at github.com/gagangeet2517-arch/gymbro/issues — say what you tapped and copy the exact error.
- iPhone user? Read **SETUP.pdf** instead — the iPhone process is different.

This PDF is generated from scripts/make_android_pdf.py — edit that file and re-run it to update the guide.
